Inter-operable PDAP Implementations

IPDA Steering Committee Meeting, Montreal 2008

Pedro Osuna

Science Archives and Computer Support Engineering Unit (SRE-OE)
European Space Astronomy Centre (ESAC)
Villafranca del Castillo, MADRID (SPAIN)

Objective

❑ To implement access to different missions' data by using the PDAP protocol

❑ This would be an inter-agency project, where at least one representative from each agency/institution with PDAP-publishable data should take part of the project

❑ The project membership should be open, and people should submit their request for belonging to the project to the Project Manager

❑ Regular teleconf around once a month should be had to measure status of ongoing work

❑ Proposal for Project Manager: *Jesus Salgado* (ESA)

Roadmap

❑ August – September 2008: Extensive Description of the project properly documented. Setting up of open mailman list for participation. Driving "Tiger Team" reduced to a smaller number of members.

❑ September - October 2008: Identification of data to be shared from the different agencies/institutions

❑ October – November 2008: Identification of possible issues related to non-PDS shareable data (are all agencies/institutions publishing their data in PDS format? Is this, otherwise, a showstopper for PDAP inter-operability? How can we provide with eventual translation layers?)

❑ December 2008: tools available for implementation of PDAP servers

❑ Jan-Jul 2008: Inter-agency implementation of PDAP access
